

a plurality of light emitting elements over the insulator, the light emitting element comprising:

an anode formed over said insulator;

at least one wiring interposed between the insulator and the anode wherein the wiring is formed in contact with one edge of the anode;

an insulating film covering at least both edges of the anode;

a cathode formed over said insulator; and

a luminescent material interposed between said anodes and said cathode.

*Dr
cont*
2. (Currently Amended) An apparatus according to claim 1, wherein said wirings is formed of a metal film.

4. (Currently Amended) An apparatus according to claim 1, wherein said anodes is formed of electrically conductive oxide films.

13. (Currently Amended) A light emitting apparatus, comprising:

an insulator;

a plurality of light emitting elements over the insulator, the light emitting element comprising:

an anode formed over said insulator, the anode extending in a first direction;

first wiring and second wiring interposed between the insulator and the anode wherein the first wiring is formed in contact with one edge of the anode, the second wiring is formed in contact with another edge of the anode, and the first wiring and the second wiring are extending in the first direction;

an insulating film covering both edges of the anode;

a cathode formed over said insulator; and

a luminescent material interposed between said anodes and said cathode.

14. (Currently Amended) An apparatus according to claim 13, wherein the first wiring and the second wiring are formed of metal films.

16. (Currently Amended) An apparatus according to claim 13, wherein said anode is formed of electrically conductive oxide films.

Please add the following new claims 30-48.

30. (New) An apparatus according to claim 1, wherein said wiring is different in material from said anode.

31. (New) An apparatus according to claim 1, wherein said wiring is made of a material lower in resistance than that of said anode.

32. (New) An apparatus according to claim 13, wherein the first wiring and the second wiring are different in material from said anode.

33. (New) An apparatus according to claim 13, wherein the first wiring and the second wiring are made of a material lower in resistance than that of said anode.

34. (New) A light emitting apparatus, comprising:

an insulator;

a plurality of light emitting elements over the insulator, the light emitting element comprising:

an anode formed over said insulator, the anode extending in a first direction wherein said anode is electrically connected to a first driver circuit which is mounted by a COG system;

first wiring and second wiring interposed between the insulator and the anode wherein the first wiring is formed in contact with one edges of the anode, the second wiring is formed in contact with another edge of the anode, and the first wiring and the second wiring are extending in the first direction;

an insulating film covering both edges of the anode;

a cathode formed over said insulator wherein said cathode is electrically connected to a second driver circuit which is mounted by the COG system; and

a luminescent material interposed between said anode and said cathode.

35. (New) An apparatus according to claim 34, wherein the first wiring and the second wiring are formed of metal films.

36. (New) An apparatus according to claim 35, wherein said metal films comprise platinum, palladium, nickel, gold, aluminum, copper, silver, tantalum, tungsten, molybdenum or titanium.

37. (New) An apparatus according to claim 34, wherein said anode is formed of electrically conductive oxide films.

38. (New) An apparatus according to claim 34, further comprising a plurality of banks arranged so as to be orthogonal to said anode.

39. (New) A light emitting apparatus, comprising:

an insulator;

a plurality of light emitting elements over the insulator, the light emitting element comprising:

an anode formed over said insulator, the anode extending in a first direction wherein first stick driver electrically connected to the anode through an anisotropic electrically conductive material;

first wiring and second wiring interposed between the insulator and the anode wherein the first wiring is formed in contact with one edges of the anode, the second wiring is formed in contact with another edge of the anode, and the first wiring and the second wiring are extending in the first direction;

an insulating film covering both edges of the anode;

a cathode formed over said insulator wherein a second stick driver electrically connected to the cathode through an anisotropic electrically conductive material; and

a luminescent material interposed between said anode and said cathode.

40. (New) An apparatus according to claim 39, wherein the first wiring and the second wiring are formed of metal films.

41. (New) An apparatus according to claim 40, wherein said metal films comprise platinum, palladium, nickel, gold, aluminum, copper, silver, tantalum, tungsten, molybdenum or titanium.

42. (New) An apparatus according to claim 39, wherein said anode is formed of electrically conductive oxide films.

43. (New) An apparatus according to claim 39, further comprising a plurality of banks arranged so as to be orthogonal to said anode.

44. (New) A light emitting apparatus, comprising:

an insulator;

a plurality of light emitting elements over the insulator, the light emitting element comprising:

an anode formed over said insulator, the anode extending in a first direction wherein a first stick driver electrically connected to the anode through a metal wire;

first wiring and second wiring interposed between the insulator and the anode wherein the first wiring is formed in contact with one edges of the anode, the second wiring is formed in contact with another edge of the anode, and the first wiring and the second wiring are extending in the first direction;

an insulating film covering both edges of the anode;

a cathode formed over said insulator wherein a second stick driver electrically connected to the cathode through a metal wire; and

a luminescent material interposed between said anode and said cathode.

45. (New) An apparatus according to claim 44, wherein said wirings are formed of metal films.

*or
cond.* 46. (New) An apparatus according to claim 45, wherein said metal films comprise platinum, palladium, nickel, gold, aluminum, copper, silver, tantalum, tungsten, molybdenum or titanium.

47. (New) An apparatus according to claim 44, wherein said anodes are formed of electrically conductive oxide films.

48. (New) An apparatus according to claim 44, further comprising a plurality of banks arranged so as to be orthogonal to said anodes.
